

Factsheet

Why is artificial grass ideal for the UAE ?

The UAE is recognised as one of the world's highest consumer of domestic water per capita and is in danger of exhausting its ground water resources, prompting the UAE federal government to initiate a campaign on water conservation. Furthermore due to rapid urban development, building regulations for the country are also under review where planners will make a percentage of green space for all new developments compulsory.

This will undoubtedly pose problems for apartments and towers as space for landscaping is limited and natural grass would be very difficult to maintain.

Therefore to help save the environment and comply with government regulations, the usage of artificial grass in landscaping is a cost-effective and sustainable alternative solution.

Product Outline

Artificial grass started to be widely used in the landscaping industry in 1990's as a conservation measure and because it also requires less maintenance and care whilst being exceptionally hard wearing. The use and production methods of artificial grass has developed rapidly, with a vast range of applications from municipal community areas, road sides and reservations, public buildings sports grounds, children play areas, private gardens, swimming pools and terraces.

Countries and regions throughout the UAE and Middle East have their own unique weather conditions, a factor that Five Star Grass has taken in to account. They have developed a range of different types of artificial grass to meet various requirements and to provide solutions for many different micro climates. Furthermore they are developing specially modified machinery that will be able to clean the grass periodically due to the drifting sand and dust.
